

Ideation Phase

Brainstorm & Idea Prioritization Template

Date 02 October 2026

Team ID _____

Project Name Implement Client Script&UI Policy (Incident)

Brainstorm&Idea Prioritization Template

Brainstorming provides a free and open environment that encourages everyone within a team to participate in creative thinking and problem solving. This session focuses on improving the ServiceNow Incident form using Client Scripts and UI Policies.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Selected Problem Statement

A ServiceNow user or support agent needs to enter and manage incident information accurately and efficiently, but the Incident form does not dynamically guide, validate, or control fields based on incident conditions, causing errors, confusion, and reduced productivity.

Team focus for brainstorming

- Improve incident data accuracy.
- Make the form respond to incident conditions.
- Reduce manual checking and user confusion.
- Use Client Scripts and UI Policies appropriately.

Step-2: Brainstorm, Idea Listing and Grouping

Ideas are grouped by purpose so the team can compare related solutions clearly.

Group 1 - Validation&Data Accuracy

Client Script focused

1. Validate important incident information before submission.
2. Show an alert or field message for invalid or incomplete input.
3. Auto-populate or validate related field values where appropriate.

Group 2 - Dynamic Form Behaviour

UI Policy focused

1. Make fields mandatory based on incident conditions.
2. Show or hide fields based on category, priority, or state.
3. Make selected fields read-only when defined conditions are met.

Group 3 - User Guidance&Efficiency

Combined approach

1. Provide field-level guidance for important inputs.
2. Clear irrelevant values when controlling selections change.
3. Automatically adjust the form to reduce unnecessary manual checks.

Step-3: Idea Prioritization

Prioritize ideas using two criteria: Importance to incident accuracy and user experience, and Feasibility using ServiceNow Client Scripts and UI Policies.

	Feasibility	
	Lower Feasibility	Higher Feasibility
Higher Importance	Consider after core implementation • Complex auto-population requiring additional logic	PRIORITIZE FIRST • Dynamic mandatory fields • Show/hide fields • Client-side validation • Alerts / field messages • Conditional read-only fields • Automatic form adjustment
Medium / Lower Importance	LOWER PRIORITY • Enhancements with limited immediate impact	IMPLEMENT NEXT • Clear irrelevant values • Simple auto-population • Field-level user guidance

Final Prioritized Ideas

Rank	Prioritized Idea	Implementation	Priority
1	Dynamic mandatory, visible/hidden and read-only field behaviour	UI Policy	High
2	Validate important values and prevent incorrect submission	Client Script	High
3	Display alerts and field messages based on user input	Client Script	High
4	Automatically adjust the Incident form based on field changes	Client Script + UI Policy	High
5	Clear irrelevant values and provide contextual guidance	Client Script / UI Policy	Medium

Final Prioritized Concept: Use UI Policies for dynamic mandatory, visibility and read-only behaviour, and Client Scripts for validation, alerts, value handling and other client-side interactions on the ServiceNow Incident form.
