

Project Design Phase-II

Customer Journey Map

Date	02 October 2026	Team ID	_____
Project Name	Implement Client Script & UI Policy (Incident)	Primary User	ServiceNow Support Agent

Scenario: A support agent creates and updates a ServiceNow Incident while Client Scripts and UI Policies dynamically validate input and control the form.

Journey	Open Incident	Enter Details	Dynamic Guidance	Validate & Correct	Submit Incident	Update / Resolve
Steps	Open the Incident form.	Enter caller, category, impact, urgency and description.	Form reacts to selected values and incident conditions.	Review warnings, mandatory fields and invalid values.	Submit the completed Incident record.	Reopen the incident later to update state or resolution details.
Interactions	ServiceNow Incident module and New Incident action.	Incident fields, dropdowns and text inputs.	Client Scripts and UI Policies change field behaviour.	Alerts, field messages, mandatory markers and read-only states.	Submit/Update action and ServiceNow platform processing.	Incident form, state fields and resolution-related controls.
Goals & motivations	Start logging the issue quickly.	Capture accurate information without unnecessary effort.	See only relevant fields and know what information is required.	Correct problems before saving the record.	Create a valid incident that can be worked on immediately.	Keep the record accurate throughout the incident lifecycle.
Positive moments	Form opens with a familiar layout.	Relevant fields are easy to identify.	Fields adjust automatically instead of requiring manual checking.	Immediate feedback prevents avoidable mistakes.	Successful submission confirms the incident was recorded.	Dynamic rules continue to guide later updates.
Negative moments	Too many fields can initially appear overwhelming.	Incorrect or incomplete values may be entered.	Conflicting or excessive rules could confuse the agent.	Repeated warnings can become frustrating if poorly designed.	Submission may be blocked when required information is missing.	Changing states can expose additional required fields.
Areas of opportunity	Keep the initial form simple and focused.	Use sensible defaults and clear field labels.	Apply UI Policies only when conditions genuinely require them.	Use concise messages that explain exactly what must be corrected.	Prevent invalid submission while avoiding unnecessary restrictions.	Keep Client Scripts and UI Policies consistent across lifecycle states.

Journey outcome: The agent completes the Incident lifecycle with fewer data-entry errors, clearer field guidance and more consistent form behaviour.
