

Project Design Phase-II

Technology Stack (Architecture & Stack)

Date 02 October 2026

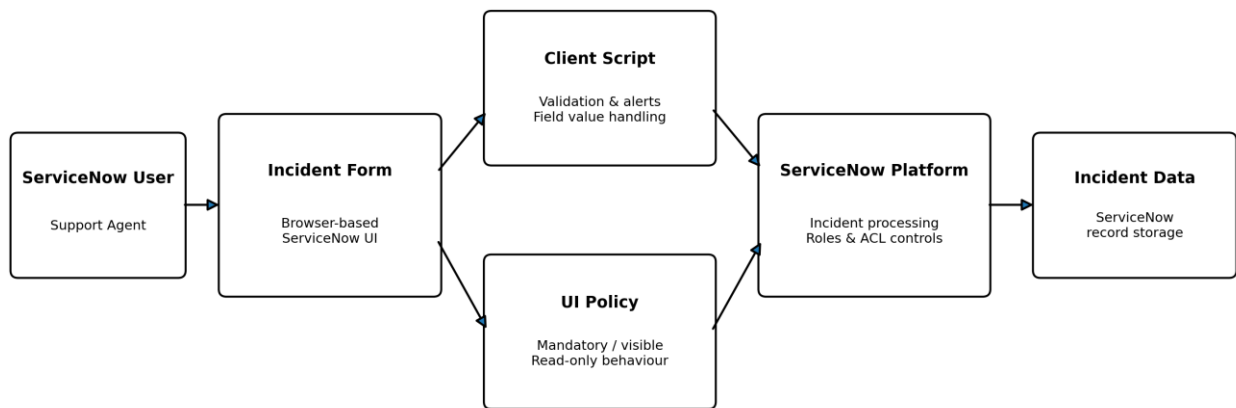

Team ID _____

Project Name Implement Client Script & UI Policy (Incident)

Technical Architecture:

The architecture below represents the ServiceNow Incident form solution and the client-side behaviour implemented through Client Scripts and UI Policies.

ServiceNow Incident - Client Script & UI Policy Architecture

Flow: User input -> Incident Form -> Client Script / UI Policy -> ServiceNow Platform -> Incident Data

Project Design Phase-II

Technology Stack (Architecture & Stack)

Table-1: Components & Technologies

S.No	Component	Description	Technology
1	User Interface	Incident form used by support agents to create and update incidents.	ServiceNow Web UI / Incident Form
2	Client-side Logic - Validation	Validates input, responds to field changes, displays alerts/messages and handles values.	ServiceNow Client Scripts (JavaScript)
3	Client-side Logic - Form Rules	Controls mandatory, visible and read-only field states based on conditions.	ServiceNow UI Policies
4	Application Platform	Processes incident records and provides platform services and business controls.	ServiceNow Platform
5	Database / Data Storage	Stores Incident records and related ServiceNow data.	ServiceNow platform database
6	Security & Access Control	Controls authorized access to records and fields; client-side rules do not replace security.	ServiceNow Roles and ACLs
7	Infrastructure (Server / Cloud)	Application is accessed through the hosted ServiceNow platform; no separate project server is required.	ServiceNow Cloud Platform

Not applicable to this project: separate file storage, external APIs and machine-learning models are not required for the defined Client Script and UI Policy scope.

Project Design Phase-II

Technology Stack (Architecture & Stack)

Table-2: Application Characteristics

S.No	Characteristics	Description	Technology
1	Framework / Platform	The solution is implemented within the existing ServiceNow platform rather than a separate open-source application framework.	ServiceNow Platform
2	Security Implementations	Authorized access is controlled through platform roles and ACLs. Client Scripts and UI Policies are used for user experience, not as security enforcement.	ServiceNow Roles / ACLs
3	Scalable Architecture	Additional Incident form rules, conditions and validations can be added as separate Client Scripts or UI Policies without redesigning the complete solution.	ServiceNow configuration model
4	Availability	The form behaviour is available whenever the ServiceNow instance and Incident application are available to authorized users.	ServiceNow Cloud Platform
5	Performance	Client-side rules are kept focused and non-duplicative so that form load and field interactions remain responsive.	Optimized Client Scripts / UI Policies

Architecture Summary

The user works with the ServiceNow Incident form. Client Scripts handle browser-side validation and field interactions, while UI Policies control field presentation and state. The ServiceNow platform processes and stores the Incident record and continues to enforce platform-level access and security controls.
