

Project Design Phase-III

Problem – Solution Fit Template

Date	04 October 2026	Team ID	_____
Project Name	Implement Client Script & UI Policy (Incident)	Primary Customer	ServiceNow Support Agent

Problem – Solution Fit: The canvas below connects the support agent’s incident-form problems and constraints with the proposed Client Script and UI Policy solution.

1. CUSTOMER SEGMENT(S) ServiceNow support agents and authorized users who create, update and manage Incident records.	4. CUSTOMER CONSTRAINTS Agents must follow incident-management rules, enter required data correctly, work within ServiceNow permissions, and complete records efficiently.	5. AVAILABLE SOLUTIONS Manual checking of fields, static mandatory settings, user training, form instructions, and standard ServiceNow configuration without dynamic client-side behaviour.
2. JOBS-TO-BE-DONE / PROBLEMS Create and update incidents quickly and accurately. Avoid incomplete or invalid information. Know which fields are required, relevant or editable for the current incident condition.	6. PROBLEM ROOT CAUSE The Incident form does not dynamically guide, validate or control all relevant fields according to changing incident values and conditions. Users therefore depend too much on manual checking.	7. BEHAVIOUR Agents enter incident details, change categories or states, respond to warnings, correct missing information and submit/update the record through the ServiceNow Incident form.
3. TRIGGERS Opening a new Incident, changing category/priority/state, entering invalid or incomplete data, or attempting to submit/update the record.	9. YOUR SOLUTION Implement Client Scripts for validation, alerts, messages and field-value handling. Implement UI Policies for conditional mandatory, visible and read-only behaviour.	8. CHANNELS & BEHAVIOUR Primary channel: ServiceNow Web UI / Incident Form. Interaction occurs through form fields, dropdowns, field messages, alerts, mandatory indicators and Submit/Update actions.

Problem–Solution Fit Conclusion: The proposed solution directly addresses the identified root cause by moving repetitive form-rule checking into dynamic Client Scripts and UI Policies, helping agents enter more consistent Incident data with clearer guidance.
