

Project Design Phase-III

Solution Architecture

Date 04 October 2026

Team ID _____

Project Name Implement Client Script & UI Policy (Incident)

Solution Architecture:

Solution architecture bridges the identified incident-form problems and the proposed ServiceNow solution. For this project, it defines how the support agent, Incident form, Client Scripts, UI Policies, ServiceNow platform controls and Incident data work together.

- Provide dynamic validation and immediate user guidance while an incident is being entered or updated.
- Use UI Policies to control mandatory, visible and read-only field behaviour according to incident conditions.
- Keep incident processing, data storage and access/security enforcement within the ServiceNow platform.
- Maintain a modular design so additional form rules and validations can be introduced without redesigning the complete solution.

Solution Architecture Diagram:

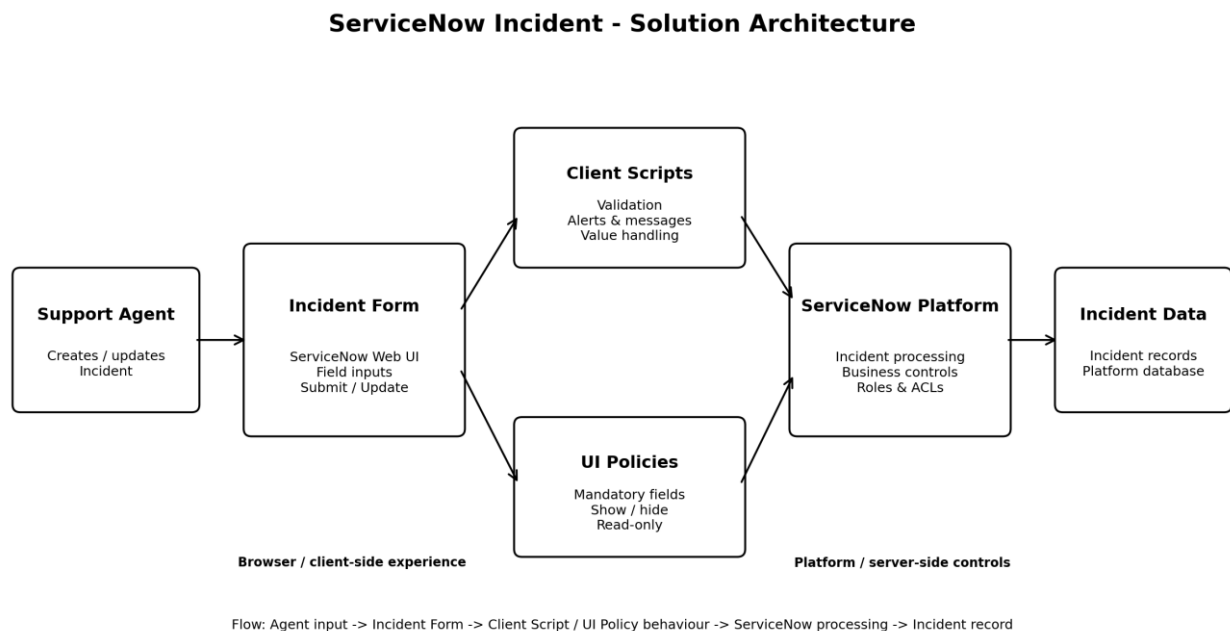

Figure 1: Architecture and data flow of the ServiceNow Incident Client Script & UI Policy solution

Architecture Flow: The support agent enters or updates incident information through the ServiceNow Incident form. Client Scripts perform browser-side validation, alerts and value handling, while UI Policies dynamically control field states. The ServiceNow platform then applies its processing and access controls before the Incident record is stored or updated.
